Cloud Computing Architecture Primer - Page 1

Cloud computing is the on-demand delivery of IT resources over the internet.
Primary service models include IaaS (Infrastructure as a Service), PaaS, and SaaS.
IaaS provides fundamental compute, storage, and networking capabilities like Amazon EC2.
PaaS provides managed development environments such as Google App Engine.
SaaS provides ready-to-use software applications like Google Workspace and Salesforce.

Cloud Deployment Models and Reliability:

Public clouds are operated by third-party providers such as AWS, Google Cloud, and Azure.

Private clouds are infrastructure operated solely for a single organization.

Hybrid clouds combine public and private environments with data orchestration.

Multi-region deployments ensure high availability with 99.999 percent uptime SLA guarantees.

Auto-scaling groups dynamically adjust virtual machine counts based on CPU utilization metrics.
